management | The BMJ

Acute kidney injury (AKI) is a widespread problem in the intensive care unit (ICU) that heralds increased morbidity, mortality, and ICU length and cost of stay, independent of other factors (1–3). Unfortunately, there are few, if any, specific interventions proven to prevent or treat AKI. Renal replacement therapy is a reactionary, supportive therapy that almost by definition is started long ...

protected from acute stroke, and these T cell effects are antigen independent. Thus, acute ischemic stroke can be redefined as a thrombo-inflammatory disorder, and multifunctional molecules such as GPIIb/IIIa, GPVI, and FXII may provide new therapeutic targets linking inflammation and thrombus formation.

Combating innate inflammation: a new paradigm for acute ...

In our experience, a more complete approach to ATAAD using our new paradigm of total aortic repair can minimize the acute hazards and reduce the need for future interventions.

Here, we propose novel concept of "Multiphase Adjuvant Neuroprotection" as a new paradigm that may help guide our search for adjunctive treatments to be used together with thrombectomy. The premise of multiphase adjuvant neuroprotection is based on the diverse and potentially nonoverlapping pathophysiologic mechanisms that are triggered before, during, and after thrombectomy therapies.
