This concept provides the opportunity to use a modular structure of

the software, i.e. different multibody formalisms may be combined

with different simulation programmes via standardized interfaces.

For the DFG project the database RSYST was chosen using

standard FORTRAN 77 and an object oriented multibody system

datamodel was defined.

Mechanical System Multibody Dynamics Simulation & Analysis ANSYS Motion, now in the Mechanical interface, is a third generation engineering solution based on an advanced multibody dynamics solver. It enables fast and accurate analysis of rigid and flexible bodies and gives accurate evaluation of physical events through the analysis of the mechanical system as a whole.

Multibody dynamics, as opposed to Multi Flexible Body Dynamics (MFBD), is the simulation of groups of bodies idealized as being perfectly rigid. Multi-body dynamics simulation software predicts the motion and the interaction forces by automatically formulating differential equations to describe the motion of a system of bodies and then solving them numerically.

This paper presents a novel recursive divide-and-conquer formulation for the simulation of complex constrained multibody system dynamics based on Hamilton ' s canonical equations (HDCA). The systems under consideration are subjected to holonomic, independent constraints and may include serial chains, tree chains, or closed-loop topologies.

A multibody dynamic (MBD) system is one that consists of solid bodies, or links, that are connected to each other by joints that restrict their relative motion. The study of MBD is the analysis of how mechanism systems move under the influence of forces, also known as forward dynamics. A study of the inverse problem, i.e. what forces are necessary to make the mechanical system move in a

Nowadays, the term multibody system is related to a large number of engineering fields of research, especially in robotics and vehicle dynamics. As an important feature, multibody system formalisms usually offer an algorithmic, computer-aided way to model, analyze, simulate and optimize the arbitrary motion of possibly thousands of interconnected bodies.

In this paper, a modular formulation of multibody systems is proposed which is based on the block representation of a multibody system with corresponding input and output quantities. Advantages of this modular approach range from independent and parallel modeling of subsystems over the easy exchange of the resulting modules to the use of different software for each module.
