Semiconductor lasers and LEDs. The development of semiconductor lasers and light-emitting diodes (LEDs) in 1962 is a great materials science story (see box: The III-V laser and LED after 45 years). They are now the basis of telecommunications, CD and DVD players, laser printers, barcode readers, you name it.

Advances in Materials (AM) publishes reviews, full-length papers, and short communications recording original research results on, or techniques for studying the relationship between structure, properties, and uses of materials. The subjects are seen from international and interdisciplinary perspectives covering areas including metals, ceramics, glasses, polymers, electrical

Technology advancement to address the world's growing demand for clean and affordable energy will require simultaneous advances in materials science and technology in order to meet the performance demands of new power-generating systems. Fuel cells emerge as highly efficient, fuel flexible, and environmentally friendly electricity producing devices.
