One of the most common titrations performed in a Chemistry lab is an acid-base titration. In the Initial Investigation, you will be assigned an acid solution to titrate with a solution of the strong base sodium hydroxide, NaOH. The concentration of the NaOH solution is given and you will determine the concentration of the acid solution.

Vernier Software & Technology 14 - 1. Investigating Acid-Base Titrations. A titration is a laboratory process used to determine the volume of a solution needed to react with a given amount of another solution One of the most common titrations performed in a Chemistry . lab is an acid-base titration.

Investigation 14 Investigating Acid-Base Titrations

In this lab, acid-base titrations will be performed in order to investigate the relationship between pH, concentration, and the structure of acids and bases. Students will carry out multiple acid-base titrations and will use a pH meter to monitor the pH of the resulting solutions. Students will then construct titration curves.

When looking at the graph of an acid base titration, the equivalence point is where the amount of acid and base is equal. The half-equivalence point is where the amount of base is equal to half the amount of acid in the solution. The curves for the titration of different strengths of acids and bases differ. A buffer solution is one that resists changes in pH.

When solving for pH using weak acid solutions, use the 5% rule.

Divide the calculated value of H^+ by the initial concentration of the weak acid (Ex. HF) and multiply it by 100, if its equal to or less than 5, the approximation can be assumed to be correct. Calculate H^+ and pH.

teacher, in the beaker. Repeat Steps 6 – 14, using acid. Testing the effect of base on other materials 17. Clean the 50 mL beaker labeled basic. Place 20 mL of test solution, obtained from your teacher, in the beaker. Repeat Steps 6 – 14, substituting base for acid. 18. If time permits, repeat Steps 16 – 17 for as many materials as you can. 19.

To find these values, we use the equation $(K_b)(K_a) = K_w$ and K_w is equal to 1.0×10^{-14} . So, to solve for the K_b of a conjugate base, you divide K_w by the K_a of the weak acid, or for a...
