LINEAR MODELS IN STATISTICS

Linear regression involves the relationship between a dependent variable (Y) and a single independent variable (X). Multiple regression models use several explanatory or independent variables (X1, X2, X3, ...Xn) to predict the value of the dependent variable. ... Appendix A 309 When we get to four carbon atoms connected to each other, there are two possible butane structures: H H H I I H-C-C-C-H I I I The one on the left is linear, or as chemists say "nor-mal," and is called n-butane, and the one on the right is branched and is called iso-butane. Thus writing these compounds as C 4H 10

This appendix specifically addresses the General Linear Model (GLM), as it is used in neuroimaging. In it we seek to go into more detail than we might in one of the primers, such as the Introduction to Neuroimaging Analysis, for those who want to understand more about how the GLM works and how to use it.

An Introduction to fMRI and PET Neuroimaging A

This chapter introduces time series data and outlines how it differs from cross sectional data. It also highlights how the object of interest when modelling time series data is the forecast, which differs from the object of interest in cross-sectional modelling, which is typically some parameter of interest that has an economic interpretation.

It assumes a background of Fourier series and transforms and of linear algebra and matrix methods. This primer presents a well balanced blend of the mathematical theory underlying wavelet techniques and a discussion that gives insight into why wavelets are successful in signal analysis, compression, detection, numerical analysis, and a wide variety of other theoretical and practical applications.
