Beating heart bypass surgery is – in simple terms – bypass surgery that is performed on your heart while it is beating. Your heart will not be stopped during surgery. You will not need a heart-lung machine. Your heart and lungs will continue to perform during your surgery. Surgeons use a tissue stabilization system to immobilize the area of the heart where they need to work. Beating heart bypass surgery is also called Off Pump Coronary Artery Bypass Surgery (OPCAB).

Off-pump coronary artery bypass or "beating heart" surgery is a form of coronary artery bypass graft (CABG) surgery performed without cardiopulmonary bypass (heart-lung machine) as a treatment for coronary heart disease. It was primarily developed in the early 1990s by Dr. Amano Atsushi.

Off-pump coronary artery bypass - Wikipedia

1 Introduction. Coronary artery bypass surgery has been performed by relatively uniform surgical techniques over the last 25 years. The short- and long-term benefits of these standard procedures have been proven .Hence, myocardial revascularization performed through a median sternotomy incision and on cardiopulmonary bypass (CPB) is still considered as the 'golden standard'.

Beating heart coronary artery surgery: is sternotomy a ...

What is beating-heart coronary artery bypass surgery and how is it performed? In an open-chest, beating-heart bypass procedure, surgeons make an incision through the breastbone to gain access to the heart.

Download Free Beating Heart Coronary Artery Surgery

In many cases, surgeons do a partial sternotomy – which is a shorter incision through the breastbone than a full sternotomy.

Beating-Heart, Off-Pump Coronary Artery Bypass Surgery ...

Coronary artery bypass surgery is performed to provide relief of angina, to improve the pumping ability of the heart muscle, to prevent heart attacks, and to reduce the use of heart medications, all of which should improve a patient's quality of life.

Traditional vs. Beating Heart Coronary Bypass Surgery

Beating heart coronary artery surgery . This is a method for performing coronary surgery which eliminates the cross clamp. In the past, when the clamp was contraindicated by an "egg shell aorta" cold fibrillation and local control of the coronaries was used.

Beating heart coronary artery surgery

The aim of coronary bypass surgery is to bypass – or ‘get around’ - the narrowed sections of your coronary arteries. The surgeon does this by grafting a blood vessel between the aorta (the main blood vessel leaving the heart) and a point along the coronary artery, past the narrowed area.

Coronary bypass surgery | BHF

During beating-heart surgery, anaesthetists face two problems: first, the maintenance of haemodynamic stability during heart enucleation necessary for accessing each coronary artery; and second, the management of intraoperative myocardial ischaemia when coronary flow must be interrupted during grafting.

Off-pump coronary artery bypass surgery: physiology and ...

Procedure The patient is brought to the operating room and moved onto the operating table. An anaesthetist places intravenous and arterial lines and injects an analgesic, usually fentanyl, intravenously,... An endotracheal tube is inserted and secured by the anaesthetist and mechanical ventilation ...

Coronary artery bypass surgery - Wikipedia

Off-pump Coronary Artery Bypass (OPCAB) has become the standard surgical treatment of Coronary Artery Disease in most centres in India. It is clear from the current evidence that, in certain patients, OPCAB offers advantages over conventional Coronary Artery Bypass Grafting (CABG). Experience of this procedure in the Armed Forces is highlighted.

Beating Heart versus Conventional Coronary Bypass Surgery ...

Minimally invasive coronary artery bypass grafting, which includes grafting the left internal thoracic artery (LITA) to the left anterior descending coronary artery (LAD) via a small thoracotomy approach without cardiopulmonary bypass, has emerged as a promising technique for the surgical revascularisation of selected patients with coronary artery disease. 1 It would be useful if surgery could be done through an even smaller incision via an endoscope.

Beating Heart Coronary Artery Surgery: Salerno, Tomas A ...

Abstract. Background: Experience with miniaturized coronary artery bypass (CAB) systems in coronary artery bypass graft (CABG) surgery on the beating heart is limited. We used a relatively new miniaturized cardiopulmonary bypass (CPB) system, which we termed assisted CAB (ACAB), to perform CABG on the beating heart in 110 patients, and we analyzed clinical outcomes in this patient group.

Consequently, there has been a growing interest in safer alternatives to CCAB, including off-pump beating heart bypass surgery (OPCAB, see Figure 1). Since the introduction of OPCAB for coronary artery disease, numerous studies have been published to evaluate the impact of OPCAB surgery compared with CCAB.

Coronary Artery Bypass Graft Surgery on the Beating Heart ...

Over the past decade coronary artery bypass grafting (CABG) on the beating heart (off-pump or OPCAB) has become a standard procedure in many centres worldwide; however, the practice of OPCAB ranges from 0% to 100% of cases, even between surgeons operating in the same unit.
