High bone turnover disease, predominantly due to uncontrolled severe hyperparathyroidism, leads to the classic bone pathology of osteitis fibrosa cystica. PTH and bone turnover markers may be very high. • Low bone turnover disease may be caused by adynamic bone disease or osteomalacia. These patients have lower PTH levels that may be in the usual adult reference range.

[Bone Pathology](#) is the second edition of the book, [A Compendium of Skeletal Pathology](#) that published 10 years ago. Similar to the prior edition, this book complements standard pathology texts and blends new but relatively established information on the molecular biology of the bone. Serving as a bench-side companion to the surgical pathologist, this new edition reflects new advances in our understanding of the molecular biology of bone.

Otosclerosis is a genetically mediated metabolic bone disease of unknown etiology. It is sometimes called otospongiosis because the disease begins with an otospongiotic phase, which is followed by an otosclerotic phase when osteoclasts are replaced by osteoblasts and dense sclerotic bone is deposited in areas of previous bone resorption.
