The minimum size for char is 8 bits, the minimum size for short and int is 16 bits, for long it is 32 bits and long long must contain at least 64 bits. The type int should be the integer type that the target processor is most efficiently working with. This allows great flexibility: for example, all types can be 64-bit.

To generalize, an object with n bits (where n is an integer) can hold 2^n (2 to the power of n , also commonly written 2^n) unique values. Therefore, with an 8-bit byte, a byte-sized object can hold 2^8 (256) different values. An object that uses 2 bytes can hold 2^{16} (65536) different values!
