Caching Architecture Guide For Net The ObjectDataSource caching feature explored in the preceding tutorial internally uses the ASP.NET data cache to store the data retrieved from the BLL. The data cache can also be accessed programmatically from ASP.NET pages code-behind classes or from the classes in the web application s architecture. For an example of how to use caching in ASP.NET applications, see Walkthrough: Caching Application Data in ASP.NET. Output Caching To manually cache application data, you can use the MemoryCache class in ASP.NET. ASP.NET also supports output caching, which stores the generated output of pages, controls, and HTTP responses in memory.

The lowest level of caching in ASP.NET Core that we are going to discuss is the caching of data using IMemoryCache and IDistributedCache. These interfaces are the standard, in-built mechanisms for caching data in.NET Core. All other techniques that we discuss later in the article rely on IMemoryCache or IDistributedCache internally.

A guide to caching in ASP.NET Core
Web caching, the focus of this guide, is a different type of cache. Web caching is a core design feature of the HTTP protocol meant to minimize network traffic while improving the perceived responsiveness of the system as a whole. Caches are found at every level of a content's journey from the original server to the browser. Web caching works by caching the HTTP responses for requests according to certain rules.

In Caching Data with the ObjectDataSource, we looked at using the ObjectDataSource's caching features to cache data in the Presentation Layer. Caching Data in the Architecture examined caching in a new, separate Caching Layer. Both of these tutorials used reactive loading in working with the data cache.

Caching. In web applications, each web request should be completed in the shortest time possible. One way to achieve this is to limit the number of external calls the server must make to complete the request. Caching involves storing a copy of data on the server (or another data store that is more easily queried than the source of the data).
