Hallanger et al.[21] developed a CFD model based on the two-fluid model approach to simulate the three-phase flow in a 3.15mx13.1m horizontal gravity separator. They neglected the effects of gas flashing, foaming and emulsification, interactions between dispersed phases, droplet breakup and coalescence.

The CFD models and numerical solution settings that are tested with low- or medium-viscosity fluids do not necessarily provide satisfactory predictions for high-viscosity fluids. In this study, we report simulations of oil-water flow with viscosity ratio of $O(10^3)$ in horizontal pipelines with $L/d = 154$ and 197 , and the flow at the downstream of the pipelines is either fully developed or nearly fully developed.

A 3D CFD model was used to simulate different configurations of an air curtain. Vertical air curtain installed outside the cold room leads a better sealing effect. The maximum sealing efficiency was observed for the down-blowing configuration. Twin air curtain, leads to a sealing efficiency comparable to a single air curtain. Horizontal air jet curtains show a poor sealing efficiency compared to vertical.

Event - Webinar: CFD Modelling for Separators – Industry Practices. Separators are commonly used in OG industry for a wide range of applications like gas-liquid separation, oil-water separation and particle separation. Their design ranges from commonly seen horizontal and vertical separators which are gravity-based, to cyclones which use the principle.

Simple LES modeling is shown by comparison with wind tunnel experiments to give better results than conventional RANS computation (RNG) modeling of the distribution of mean concentration. The horizontal diffusion of concentration is well reproduced by LES, mainly due to the reproduction of unsteady concentration fluctuations in the street canyon.

The performance and internal multi-phase flow behavior in a three-phase separator was investigated. The separator considered represents an existing surface facility belonging to Abu Dhabi Company for Onshore Oil Operations ADCO. A first approach, using the Eulerian-Eulerian multi-phase model implemented in the code ANSYS FLUENT, assumed mono-dispersed oil and water secondary phases ...

Three different CFD models were used with respect to the modelling of turbulent dispersion and the use of certain drag correlation. The particles rope is largely not disintegrated along the vertical pipe when the turbulent dispersion force is not included (Fig. 7c), which is not consistent with experimental observation. This is different from the horizontal and vertical pneumatic conveying, where spatial distributions of solids concentrations remain nearly the same whether turbulent ...

The use of a pneumatic conveying technique for the transportation of drill cuttings within and from offshore drill rigs is a new and challenging research field at present. In addition to experimental techniques, computational fluid dynamics (CFD) can be used for detailed understanding of the process. CFD modelling of pneumatic conveying is not very new; however, the nature of the drill cuttings introduces additional challenges for the modelling work.
