Equilibrium: An object at rest is said to be in static equilibrium when all forces acted upon the object are balance or when the vector sum of all forces action on a body is zero.

Chapter 2 Static Equilibrium | Center Of Mass | Force

For static equilibrium of the isolated particle, the resultant of the two forces I Wacting downward and Racting upward I must be zero. RWI = 0 This leads to the not very earth shaking conclusion that the magnitude of the reaction force, acting up, must equal the weight.

Chapter 2 Newton's First Law of Motion-Inertia. Static Equilibrium. 1. Little Nellie Newton wishes to be a gymnast and hangs from a variety of positions as shown. Since she is not accelerating. the net lorce on her is zero. That is, '£F=O. This means the upward puu 01 the rope(s) equals the down- ward pUll of gravity. The second equilibrium condition for the static equilibrium of a rigid body expresses rotational equilibrium: $\|k\|\| = 0$... The second equilibrium condition, Figure, is the equilibrium condition for torques that we encountered when we studied rotational dynamics.

Chapter 2 Static Equilibrium Force And Moment What is the net force on an object in either static or dynamic equilibrium? The net force is zero If you push on a crate with a horizontal force of 100 N and it slides at constant velocity, what is the magnitude and direction of the frictional force acting on the crate?

tension, the forces acting at this point are as shown. Since this junction in the strings is in static equilibrium, the (vector) sum of the forces acting on it must give zero. Thus the sum of the x components of the forces is zero: $T1 \sin 35 + T2 = 0$ (3.4) and the sum of the y components of the forces is zero: $+T1 \cos 35$ #40N = 0 (3.5)

Statics is primarily the study of bodies in static equilibrium. There are two conditions necessary for static equilibrium: the net force on a body equals zero and the net torque on a body equals zero. This is why we have waited until after discussing rotations to consider statics.

All forces acting on each stilt walker balance out; neither changes its translational motion. In addition, all torques acting on each person balance out, and thus neither of them changes its rotational motion. The result is static equilibrium. (credit: modification of work by Stuart Redler)
