Chapter 35 Circulatory and Respiratory Systems

Chapter 35. Human respiratory system. • In humans, air moves through the nose, the pharynx, trachea, and bronchi to the lungs. • Lungs terminate in an elongated space enclosed by a multitude of air pockets called alveoli, which fall the internal region of the lungs and are the location of the gas exchange.

Chapter 35 An Overview of the Pulmonary System. Eric Honig. The diagnosis of Page 10/18

pulmonary diseases and disorders requires the integration of pulmonary history and physical examination data acquired at the bedside with data provided by chest roentgenograms and the pulmonary function and blood gas laboratories.

Chapter 35 An Overview of the Pulmonary System

The respiratory tract may be divided into upper and lower portions. The upper portion consists of the nose, sinuses, oropharynx, and larynx. The lower portion comprises the trachea and lungs with their associated airways. Disorders and drug Page 11/18

therapy of the upper respiratory system differ from those of the lower respiratory tract.

&chapter 35 respiration. all answers Biology Stuvia

22.1: The Respiratory
System. The respiratory
system is comprised of the
organs that enable
breathing. Air enters the
nostrils and mouth, followed
by the pharynx (throat) and
larynx (voice box), which
lead to the trachea
(windpipe). In the thoracic
cavity, the trachea splits
into two bronchi that allow
air to enter the lungs.
