Solving for the arbitrary constants,  $x(0) = -4C - 2D = 0$ , or  $C = -$  and  $D = 10/65$ . The final solution is  $x = -18/3 - 4t/15 - 2t/10 e^{-t} + \sin 3t \cos 3t/26 - 65/10$ . Assume a particular solution of  $x_p = A$ . Substitute into the differential equation and obtain  $25A = 10$ , or  $A = 2/5$ .

Solution is  $i(t) = Ae^{-(R/L)t} + 1 R$ .  
Solving for the arbitrary  
constants,  $i(0) = A + 1 R = 0$ .  
Thus,  $A = -1 R$ . The final  
solution is  $i(t) = 1 R e^{-1 R t}$

Engineering, 7th Edition has become the top selling text for this course. It takes a practical approach, presenting clear and complete explanations. Real world examples demonstrate the analysis and design process, while helpful skill assessment exercises, numerous in-chapter examples, review questions and problems reinforce key concepts.

Highly regarded for its accessibility and focus on practical applications, Control Systems Engineering offers students a comprehensive introduction to the design and analysis of feedback systems that support modern technology. Going beyond theory and abstract mathematics to translate key concepts into physical control systems design, this text presents real-world case studies, challenging chapter questions, and detailed explanations with an emphasis on computer aided design.

Control Systems Engineering, 4th Edition. Norman S. Nise. Emphasizing the practical application of control systems engineering, the new Fourth Edition shows how to analyze and design real-world feedback control systems. Readers learn how to create control systems that support today's advanced technology and apply the latest computer methods to the analysis and design of control systems.\*.
