Although ventilation remains a very important component of CPR in children, rescuers who are unable or unwilling to provide breaths should be encouraged to perform at least compression-only CPR. A child is far more likely to be harmed if the bystander does nothing. All providers should be encouraged to initiate CPR in children even if they haven't been taught specific paediatric techniques. CPR should be started with the C:V ratio that is familiar and, for most, this will be 30:2.
