In mathematics, a differentiable nic manifold (also differential manifold) is a type of manifold that is locally similar enough to a linear space to allow one to do calculus. Any manifold can be described by a collection of charts, also known as an atlas. One may then apply ideas from calculus while Page 21/33

In particular, harmonic functions, i.e. harmonic forms of degree zero, are Page 23/33 **Download File PDF Differentiable Manifolds** constant on a connected compact manifold. Harmonic forms on a compact Riemannian manifold are invariant with respect to any connected group of isometries of this manifold; for a symmetric space \$ M \$ the space $H^{(M)}$ the space $H^{(M)}$ with the space of \$ p \$- forms which Page 24/33

are invariant with respect to the largest connected group of isometries.

Geometry of Differential Formsonic The treatment is based on the concept of current which is closely related to that of distribution in the sense of Laurent Schwartz, A current can in fact be regarded as a differential form whose coefficients are distributions. Chains and (ordinary) differential Page 29/33

Download File PDF Differentiable Manifolds forms can be identified as currents in the manner indicated below. This is the guiding principle by which the author shows how the homology properties of a manifold are revealed simultaneously through its chains and its differential
