The first bursts of life found in the fossil record were single-celled bacteria and algae, the foundation of life that led to the extraordinary cavalcade of organisms that have walked the stage of Earth ever since. From the initial signs of life in the Precambrian Period to the end of the Cambrian Period about 488 million years ago, "Early Life" explores the development of early life that culminated in one of the most extraordinary periods in the evolution of life on Earth.

Before the Cambrian period, 542 million years ago, life on earth consisted of single-celled bacteria, algae, and only a handful of multicellular animals--but after the Cambrian, multi-celled vertebrate and invertebrate animals dominated the world's oceans.

The Cambrian Period. The Cambrian Period marks an important point in the history of life on Earth; it is the time when most of the major groups of animals first appear in the fossil record. This event is sometimes called the "Cambrian Explosion," because of the relatively short time over which this diversity of forms appears.

Cambrian Period - Cambrian Period - Paleoclimate: Global climate during Cambrian time was probably warmer and more equable than today. An absence of either land or landlocked seas at the Cambrian poles may have prevented the accumulation of polar ice caps. The general absence of glacial till deposits of Cambrian age is more notable, because these deposits are common and widespread in upper ...

I purchased this book hoping for a review of the Cambrian Period. Notice the title does say "Early Life The Cambrian Period". Yet the book is 224 pages long and the discussion of the Cambrian Period starts on page 160. Even once we FINALLY get to the supposed topic, the information is very superficial.

Other dominant Cambrian invertebrates with hard parts were trilobites (like the one on the upper left, Nevadella from the Lower Cambrian of southwest Nevada); archaeocyathids (relatives of sponges that were restricted to the Lower Cambrian), and problematic conical fossils known as hyolithids (like the one on the upper right, also from the Lower Cambrian of Nevada). Many Early Cambrian invertebrates are known only from "small shelly fossils" - tiny plates and scales and spines and tubes and ...

Precambrian life. Precambrian rocks were originally defined to predate the Cambrian Period and therefore all life, although the term Proterozoic was later coined from the Greek for "early life.". It is now known that Precambrian rocks contain evidence of the very beginnings of life on Earth—which, based on the age of the rocks that contain the oldest evidence of life, took place nearly 3.5 billion years ago—the explosion of life-forms without skeletons before the Cambrian, and even ...
