Electron-Phonon Interactions in Low-Dimensional Structures - Oxford Scholarship. The study of electrons and holes confined to two, one, and even zero dimensions has uncovered a rich variety of new physics and applications. This book describes the interaction between these confined carriers and the optic and acoustic phonons within and around the confined regions.

Electron-Phonon Interactions in Low-Dimensional Structures ...

Recent theoretical studies have shown that charge transport in high-mobility organic semiconductors is limited by low-frequency vibrations because of strong non-local electron-phonon interaction. Here we investigate two high-electron-mobility organic semiconductors with similar molecular structures but considerably different crystal packings, TCNQ and F₂-TCNQ, and reveal the relationship between the experimental low-frequency Raman spectra and the calculated contributions of various ...

Electron-phonon and phonon-phonon interaction mechanisms are discussed for bulk semiconductors as well as low-dimensional structures.

Low temperature magnetoresistance measurements in GaAs-GaAlAs heterojunctions with more than one occupied electric subband. Shubnikov-de Haas oscillations in perpendicular magnetic fields contain non-additive terms at electron temperatures $> 2K$, where acoustic phonon mediated inter-subband scattering is comparable to intra-subband scattering.

The electron-lattice interaction, i.e., the energy exchange between the electrons and lattice, is due to the radiation and adsorption of phonons and is known as the electron-phonon interaction. As the temperature is lowered, the amplitude of the ions becomes smaller, and the electrical resistance is reduced.

Resonance Raman spectra and deformation potential analysis show that strong electron-phonon interactions result in fast non-radiative decay, and that this lowers the photoluminescence quantum yield (PLQY).

The low temperature electron-phonon interaction is also an elementary process for several other phenomena and applications. The electron-phonon interaction determines the cooling time of the electron gas, if the electrons are not cooled by out diffusion (see Chapter 2).

(e-ph) interactions, the maximal phonon momentum in an e-ph scattering event is limited to $2k_F$, representing a full backscattering of the electrons across the Fermi surface of radius k_F . Since in metals k_F is of the size of the Brillouin Zone (BZ), $2k_F > k_D$, all populated phonons can scatter off electrons. For low density electron systems,

Electron-Phonon Interactions in Low-Dimensional Structures ...

Electron-phonon and phonon-phonon interactions in low-dimensional nanostructures. The electron-phonon interaction gives rise to a number of physically measurable quantities in solid state physics, perhaps most notably the heat capacity and the finite electrical resistivity in metals. The effect of extreme quantum confinement on the electron-phonon interaction is investigated for single-atom thick, infinitely long chains of metallic Al, Cu, Ag and Au atoms using density functional ...

A simple bulk model of electron-phonon coupling in metals has been surprisingly successful in explaining experiments on metal films that actually involve surface- or other low-dimensional phonons. However, by an exact application of this standard model to a semi-infinite substrate with a free surface, making

Similarly, the electron-phonon interaction plays a relevant role in other transport properties, e.g., thermoelectricity, in low-dimensional systems such as layered Bi and Sb chalcogenides and in quasi-crystalline materials which are often viewed as periodic solids in higher dimensions.

The soft lattice is considered to be important in defining their interesting optoelectronic properties. Electron-phonon coupling governs hot-carrier relaxation, carrier mobilities, carrier lifetimes, among other important electronic characteristics.
