Elliptic Curve Cryptography (ECC) is a public key cryptography method, which evolved from Diffie Hellman. To understanding how ECC works, let's start by understanding how Diffie Hellman works. The Diffie Hellman key exchange protocol, and the Digital Signature Algorithm (DSA) which is based on it, are asymmetric cryptographic systems in general use today.

But for our aims, an elliptic curve will simply be the set of points described by the equation: $y^2 = x^3 + ax + b$ where $4a^3 + 27b^2 \neq 0$ (this is required to exclude singular curves). The equation above is what is called Weierstrass normal form for elliptic curves. Different shapes for different elliptic curves ($b = 1$, a varying from 2 to -3).

~~A Gentle Introduction to Elliptic Curve Cryptography~~

Elliptic curve cryptography (ECC) was proposed by Victor Miller and Neal Koblitz in the mid 1980s. An elliptic curve is the set of solutions (x,y) to an equation of the form $y^2 = x^3 + Ax + B$, together with an extra point O which is called the point at infinity.

The Equation of an Elliptic Curve
An Elliptic Curve is a curve given by an equation of the form $y^2 = x^3 + Ax + B$
There is also a requirement that the discriminant $\Delta = 4A^3 + 27B^2$ is nonzero.
Equivalently, the polynomial $x^3 + Ax + B$ has distinct roots.

elliptic curves over finite fields. ECC allows smaller keys compared to non-EC cryptography to provide equivalent security. Elliptic curves are applicable for key agreement, digital signatures, pseudo-random generators and other tasks. Indirectly, they can be used for encryption by combining the key agreement with a symmetric encryption scheme. They are also used in several integer factoriza

~~Elliptic curve cryptography - Wikipedia~~
Elliptic curve cryptography, just as RSA cryptography, is an example of public key cryptography. The basic idea behind this is that of a padlock. If I want to send you a secret message I can ask you to send me an open padlock to which only you have the key. I then put my message in a box, lock it with the padlock, and send it to

A (nonsupersingular) elliptic curve E over the finite field F_2^m is given through an equation of the form

$$Y^2 + XY = X^3 + aX^2 + b, \quad a, b \in F_2^m. \quad (4)$$

Before starting with the arithmetic of the points on an elliptic curve, we take a final look at the coefficients in equation (1). The subscripts of these coefficients seem to be a little bit strange.

We will omit implementation details and mathematical proofs, we can save those for another article.
