Population Growth - Environmental Studies

Factors Effecting Environment: Population Growth | Impact of Population Growth | Environmental Science Human Population Concept

The environmental consequences of any human population are a function of a number of interacting factors, but two are especially important: the number of people and their per-capita environmental impact. The per-capita impact is related to both the lifestyles of individual people and the level of technological development of their society.

Which of the examples below describes an effort to address urban sprawl through urban green space? •	 A new restaurant is constructed on a lot on the edge of town bypassing several vacant lots within the city. •	 The city converts an old factory downtown into affordable housing for young people. •	 The city razes a former dry cleaners downtown cleans up the chemicals in ...

Sophia - environmental science - final milestone 100 ...

Desertification is a type of land degradation in drylands in which biological productivity is lost due to natural processes or induced by human activities whereby fertile areas become increasingly arid. It is the spread of arid areas caused by a variety of factors, such as climate change (particularly the current global warming) and overexploitation of soil as a result of human activity.
