Frontiers | Frugivory and Seed Dispersal by Lizards: A ...

In recent years, it has become clear that frugivory and seed dispersal (FSD) by turtles and tortoises is much more common than previously thought. We here review published and unpublished records of chelonian FSD, and assess the role of chelonians as seed dispersers, from individual species to the community level.

(PDF) Frugivory and Seed Dispersal by Terrestrial Mammals

Without frugivores, plants will go extinct if their intrinsic local dispersal ability is below a threshold (i.e., when the number of the nearest-neighbouring sites z is small; Fig. 4c); in contrast, seed dispersal by frugivores can allow conditional persistence of plants even when the dispersal ability of plants is below such a threshold (Fig. 4d). When the plant local dispersal ability is relatively high, plants can access more neighbouring sites and thus have a higher

Frugivory and seed dispersal: Extended bi-stable ...

Many plants rely on fruit consuming animals (frugivores) to disperse their seed.

Successful dispersal is influenced inter alia by quantity of seeds dispersed, dispersal distance, nature of seed deposition and post-depositional seed predation. The germination potential of the seed is commonly enhanced through physical or chemical scarification while the ingested fruit is processed in the gastrointestinal tract.

Frugivory and seed dispersal revisited: Codifying the ...

Abstract. Seed dispersal is a key process in plant communities and frugivory is very important in vertebrate communities. This paper updates a review of frugivory and seed dispersal by vertebrates in the Oriental Region (tropical and subtropical Asia) published in 1998. The major conclusions remain the same.

Frugivory and seed dispersal by tapirs: An insight on ...

Seed dispersal systems in degraded areas can be compromised following the decline of large-bodied frugivore populations responsible for their dispersal. In this context we examined the seed dispersal ecology of a large fruited deciduous tree (*Dillenia pentagyna*) along a forest degradation gradient in India. We examined the effect of structural components

A frugivore /fru:dʒɪvɔːr/ is an animal that thrives mostly on raw fruits, succulent fruit-like vegetables, roots, shoots, nuts and seeds. Approximately 20% of mammalian herbivores eat fruit. Frugivores are highly dependent on the abundance and nutritional composition of fruits. Frugivores can benefit or hinder fruit-producing plants by either dispersing or destroying their seeds through digestion. When both the fruit-producing
