Structured programming is a programming paradigm aimed at improving the clarity, quality, and development time of a computer program by making extensive use of the structured control flow constructs of selection (if/then/else) and repetition (while and for), block structures, and subroutines in contrast to using simple tests and jumps such as the go to statement, which can lead to “spaghetti code” that is potentially difficult to follow and maintain.

We can be the solution.

Fundamentals Of Structured Program Design

Program design consists of the steps a programmer should do before they start coding the program in a specific language. These steps when properly documented will make the completed program easier for other programmers to maintain in the future. There are three broad areas of activity: Understanding the Program; Using Design Tools to Create a Model; Develop Test Data

Program Design – Programming Fundamentals

It is most often an iterative process involving research, consultation, initial design, testing and redesign. A program design is the plan of action that results from that process. Program theory – a statement of assumptions, based on evidence, as to why a program should result in the intended outcomes.⁴ When organizations set out to

Structured design is the art of designing the components of a system and the interrelationship between those components in the best possible way. Structured design is the process of deciding which components interconnected in which way will solve some well-specified problem. “Design” means to plan or mark out the form and method of a solution.
