Interferences Of Commercial No Atmos Meas Tech

Detection of NO₂ is a difficult task since many of the different commercial techniques used are affected by interferences. The chemiluminescence instruments that are used for indirect NO₂ detection in monitoring networks and smog chambers use either molybdenum or photolytic converters and are affected by either positive (NO_y) or negative interferences (radical formation in the photolytic converter).

the smog chamber experiments.

Whereas all the commercial instruments showed strong interferences, excellent agreement was obtained between a new NO₂-LOPAP instrument and the FTIR technique for the measurements performed in the smog chamber

Interferences of commercial NO₂ instruments in the urban ...

Commercial “ NO_x ” instruments are in common use because the interferences do not cause a problem when such monitors are deployed to demonstrate attainment with NO₂ standards – they provide an upper bound on NO₂ and NO_x concentrations. So while these monitors can be useful, they generate numbers with variable, and often
