JPEG stands for Joint Photographic Expert Group. A standard image compression method is needed to enable interoperability of equipment from different manufacturer. It is the first international digital image compression standard for continuous-tone images (grayscale or color). Why compression is needed?

The JPEG Still Picture Compression Standard

Abstract: A joint ISO/CCITT committee known as JPEG (Joint Photographic Experts Group) has been working to establish the first international compression standard for continuous-tone still images, both grayscale and color. JPEG's proposed standard aims to be generic, to support a wide variety of applications for continuous-tone images. To meet the differing needs of many applications, the JPEG standard includes two basic compression methods, each with various modes of operation.

Later JPEG developed the “ ADCT ” and formalized it, so is the first international still-image compression standard. --JPEG encoder and decoder makes the user to be able to change the parameters so they can control the compression/quality tradeoff. When we say a “ very good ” image quality, the compression rate must be in a acceptable level.

The JPEG 2000 Still Image Compression Standard

JPEG (/ d e p / JAY-peg) is a commonly used method of lossy compression for digital images, particularly for those images produced by digital photography. The degree of compression can be adjusted, allowing a selectable tradeoff between storage size and image quality. JPEG typically achieves 10:1 compression with little perceptible loss in image quality.

JPEG is a still frame compression standard, which is based on, the Discrete Cosine Transform and it is also adequate for most compression applications. The discrete cosine transform (DCT) is a mathematical function that transforms digital image data from the spatial domain to the frequency domain.
