Data and Tools. Livestock water use is water associated with livestock watering, feedlots, dairy operations, and other on-farm needs. Livestock includes dairy cows and heifers, beef cattle and calves, sheep and lambs, goats, hogs and pigs, horses, and poultry. Other livestock water uses include cooling of facilities for the animals and products, dairy sanitation and wash down of facilities, animal waste-disposal systems, and incidental water losses.

Water Resources and

Livestock: An increasing constraint. Water is essential for life. More than half of all potable water is from rivers and lakes and more than one-sixth of the Earth's population rely on glaciers and seasonal snowfall for their water supply. However, the increase in surface temperatures is causing profound alterations in the hydrological cycle, particularly in regions where water supply is currently dominated by melting snow or ice.

Warm water: Stock avoid warm water in hot weather, so deeper or shaded water sources will generally be preferred. Pipes carrying water above ground may deliver very hot undrinkable water to troughs. Lupin stubbles and weaner sheep: In summer and autumn, weaner sheep on lupin stubbles (and possibly other high protein diets) will not travel more than 500-600 metres from a water source.

Protecting water quality on livestock farms | Dairy ...

Livestock production and processing may impact water and land resources through pollution. This is due to losses of nutrients and other substances, e.g., pesticides and chemicals. Losses eventually migrate into the ecosystems through the food chain and through water flows and affect the fauna and the flora, as well as fisheries, recreation, and drinking water.
