Dysplasia can be flat or form a mass (dysplasia associated lesion/mass [DALM]). Dysplasia in UC is graded as negative, indefinite, low grade, high grade, or carcinoma. • The differential diagnosis of DALM is sporadic adenoma. The distinction between the two is difficult and requires clear communication between the pathologist and the endoscopist.

Dysplasia is any of various types of abnormal growth or development of cells and/or organs, and/or the abnormal histology or anatomical structure presumably resulting from such growth. Dysplasias on a mainly microscopic scale include epithelial dysplasia and fibrous dysplasia of bone. Dysplasias on a mainly macroscopic scale include hip dysplasia, myelodysplastic syndrome, and multicystic dysplastic kidney. In one of the modern histopathologic senses of the term, dysplasia is sometimes different

~~Dysplasia — Wikipedia~~

Normal values are greater than 25 degrees. Angles between 20 and 25 degrees are considered mild or borderline dysplasia. Values less than 20 indicate more severe dysplasia. Symptoms of hip dysplasia. In adolescents and adults, dysplasia is most commonly manifested as activity-related hip pain and, occasionally, a limp.
