This thesis consists ofthree articles on the application ofnumerical methods. Each article addresses important research questions in economics and finance by making use ofthe new numerical analysis and simulation based estimation techniques. In the first article ofthe thesis, I examine the finite sample performance ofsimulation

Applications of Numerical Methods in Economics and Finance

This course, taught by Ken Judd, introduces computational approaches for solving economic models. It focuses on a broad range of numerical methods and then applies them to economic problems. We formulate economic problems in computationally tractable forms and use numerical analysis techniques to solve them.

Mathematical economics is the method of using mathematics in calculating economic variables. The method embraces a huge variety of mathematical equations that aim to determine the current and future state of an economy. For example, mathematical economic methods are used to determine the unemployment rates in a country.
