Design Aids are Instrumental in Constructing Concrete Buildings. Slightly more than half of all low-rise buildings in the United States are constructed from concrete. Designers select concrete for one-, two-,

and three-story stores, restaurants, schools, hospitals, commercial warehouses, terminals, and industrial buildings because of its durability and ease of construction.

Design Procedure 1. Choose a trial slab thickness (h). 2. For each axle load class: a) Determine N_i for fatigue failure. b) Divide n_i by N_i to determine fatigue damage factor d_i . c) Determine N_i for erosion failure. d) Divide n_i by N_i to determine erosion damage factor d_i . 3. Sum fatigue and erosion damage factors over all of the axle load classes. 4.

The Portland Cement Association (PCA) has publications for designing rectangular and circular tanks. Some of the design provisions differ from that of the American Concrete Institute (ACI) specifications. Many in the industry use these PCA design concepts, so we will adapt them for our calculations as well. Much of the PCA publication is comprised of tables of coefficients for calculating moment and shear in two-way slabs.
