Assumptions Involved In The Design Of Pile Caps 1- Pile cap is perfectly rigid. 2- Pile heads are hinged to the pile cap and hence no bending moment is transmitted to piles from pile caps. 3- Since the piles are short and elastic columns, the deformations and stress distribution are planar.

~~Design Of Pile Cap - Engineering Discoveries~~

The pile cap should overhang the outer piles, typically by a distance of 100-150 mm on all sides, depending on the size of the piles. Pile caps are constructed by excavating an area around the group of piles to enable formwork to be inserted. The pile tops may be trimmed to ensure they are at the same height.

Detail of Pile Cap, Pile Cap Design, Pile Cap Dimensions and thickness, pile cap reinforcement, Piles A pile cap is one of the types of foundation that consist of a thick concrete pad that is usually supported by piles. This is commonly used in building foundations with the geographical locations having a very low soil bearing capacity.

A pile cap is a mass concrete structure contains more piles embeds in it. A group of pill drives into clay, soft, and loose soils to provide a strong, stable and suitable foundation. The pile designs considering the punching shea around the heads of the piles and column base.

Design the pile cap shown in the following figure with 12 in. diameter piles and a service load capacity of 50 tons each. The pile cap has normal-weight concrete with a compressive strength of 4000 psi and Grade 60 reinforcement. And the piles are embedded 4 in. into the pile cap.

A pile cap have to support a 18"X18" column which is subjected to live load=170 kips and dead load=160 kips under service loading. The column is reinforced with longitudinal bars of 12 No. 7 bars. Consider $f_y=60$ Ksi and $f'_c=3$ Ksi. The diameter of pile is 12".

~~Design Example of Pile Cap for Concentric Loading - Civil ...~~

The main components of the foundation are the pile cap and the piles. Piles are long and slender members which transfer the load to deeper soil or rock of high bearing capacity avoiding shallow soil of low bearing capacity The main types of materials used for piles are Wood, steel and concrete.

~~Pile Foundation Design[1] - ITD~~

It relies on the strut and tie method to determine the amount of reinforcement required in the pile-cap; which is dependent upon the depth of the cap, the magnitude of the axial load being placed upon it, the cap's concrete strength and the pile size and spacing.

~~Technical Guidance Note (Level 2, No. 8): Designing a pile cap~~

A pile cap is a thick concrete mat that rests on concrete or timber piles that have been driven into soft or unstable ground to provide a suitable stable foundation. It usually forms part of the deep foundation of a building, typically a multi-story building, structure or support base for heavy equipment, or of a bridge.

CRSI's design guide doesn't approach pile cap design from an STM perspective so you may not want to run out and buy it. They take sort of a modified sectional design approach where the shear and detailing provisions are informed by strut and tie although STM is not used explicitly. There's a blurb in the front matter where they state that STM is actually un-conservative for some pile cap ...

Since the pile cap is like a slab (but on the ground) we can use the SAFE program by CSI to design a pile cap. We just need to model this as a slab with its properties and incorporating the spring constant (ks) and assign the value of whatever is the result corresponding to the pile that we are going to use.

The pile cap should be primarily designed considering the punching shear, for the punching shear around the heads of the piles and around the column base. Pile cap should also be designed for bending moment due to the transmission of loads from columns to the individual piles. Shape of Pile Cap:
