Like other drive units, a key element of sizing a rack & pinion system is to check that the transmitted torque doesn't exceed the maximum allowable torque, which is based on the pinion design, rack hardness and strength, and tooth pitch. Also important to consider is the pitch deviation, which affects positioning accuracy.

Profiled rail + rack & pinion = integrated solution

An important principle is that you realize that the calculation and selection (rack, pinion, gearbox and motor) is done by trial-and-error: you have to do the calculations again with other parameters, such as the diameter of the pinion or the quality (read in this case: hardness) of the rack.
