Radon As A Groundwater Tracer

Radon-222 and Chloride as Natural Tracers of the Infiltration of River Water into an Alluvial Aquifer in Which There Is Significant River/Groundwater Mixing. Environmental Science & Technology 1994 , 28 (5) , 794-798.

Radon-222 as a groundwater tracer. A laboratory study ...

The radon concentration in the groundwater of the Chalk, SE England, a fissured aquifer, was measured at 16 sites over a period of 15 months to assess its potential as a natural groundwater tracer. Each site demonstrated appreciable radon concentration variation over this period, apparently in response to changes in hydraulic conditions within the aquifer.

Radon as a natural groundwater tracer in the chalk aquifer ...

2.1. Natural Occurrence of Radon in Groundwater [9] A main reason for the suitability of radon as a single-well tracer is its ubiquitous occurrence in groundwater. In every aquifer matrix, radon is constantly produced by the radioactive decay of the ubiquitously occurring radioisotope radium-226.

Using radon as an environmental tracer for estimating ...

groundwater generally has a higher radon concentration than surface water. It is like a natural “dye” in which the groundwater with its very high radon is easily detected above the background radon in the surface water body. Radon-222 has a half-life of 3.8 days, so it is ideal for evaluating processes that occur on time scales of up to 3 weeks.

Radon-222 as a tracer of surface water – groundwater ...

This means that radon probably is a poor tracer for recharging groundwater in the Forsmark area since recharge is only identified at one site. Four wells had radon concentration significantly higher than the steady state radon concentration. This indicates discharge of deep groundwater with high radon concentration from conductive

Radon as a groundwater tracer in Forsmark and Laxemar

Radon is a noble gas and behaves as a conservative tracer. Due to its half-life of 3.8 days, residence times of the groundwater of up to -15 days (-4 half-lives) can be calculated from the radon activity. During the infiltration of surface water, which has a low radon activity, radon starts to grow as the water moves in

Sci. Technol. Radon-222 as a Groundwater Tracer. A ...

As mentioned previously, in streams and lakes where groundwater enters in pulses or discrete locations, radon may not be as useful of tracer for quantifying groundwater inflows. However in streams or lakes. where there is continuous groundwater inflow, radon as a tracer may be a valuable tool.

USING NATURALLY OCCURRING RADON 222 AS A TRACER TO ...

One of the most powerful applications of radon as a tracer is in locating and quantifying the amount of non-aqueous phase liquids present in subsurface contaminated or industrial sites. With a sub-decameter spatial resolution, radon serves as a tool for in-situ monitoring of the location of free-phase plumes of LNAPLs.

Radon in Groundwater System | SpringerLink

Radon can be used as a naturally occurring tracer for environmental processes. By means of grab-sampling or continuous monitoring of radon concentration, it is possible to assess several types of...

(PDF) Radon as Tracer in Environmental Sciences

Dissolved helium and radon anomalies are used to quantify groundwater input to Florida Bay waters. The method relies on the fact that groundwater dissolves large quantities of 4He and 222Rn isotopes, radioactive decay products of the uranium-chain elements, which accumulate over geological time periods. Seasonal surveys in Florida Bay show

Helium and Radon as Tracers of Groundwater Input into ...

In this study radon (222Rn) dissolved in the groundwater is used as the tracer. The flow rate of groundwater through the reactors is 1 l/h. Over a period of 8 hours the radon-spiked groundwater was injected into the natural groundwater which has a very low radon concentration. The radon concentration of the discharged water is measured online ...

Radon as a tracer to determine the mean residence times of ...

Radium and radon mass balance models have been widely used to quantify submarine groundwater discharge (SGD) in the coastal areas. However, the losses of radium or radon in seawater caused by recirculated saline groundwater discharge (RSGD) are ignored in most of the previous studies for tracer-based models and this can lead to an underestimation of SGD.

Improving Estimation of Submarine Groundwater Discharge ...

Using radon as tracer of an old NAPL contamination in groundwater (Roma, Italy) Alessandra Briganti 1, Mario Voltaggio 2, Michele Soligo 1, Paola Tuccimei , Claudio Carusi 3, Carlo Lucchetti 1, 4, Mauro Castelluccio 1, 4 14th INTERNATIONAL WORKSHOP GARRM - September 2018, Prague, Czech Republic 1 Università “Roma Tre”, Dipartimento di Scienze, Roma, Italy

Using radon as tracer of an old NAPL contamination in ...

On the one hand, the half-life of radon and its solubility have allowed the use of radon gas as a natural groundwater tracer to identify and quantify groundwater discharge to surface waters [4, 5, 6] or to attempt to elucidate the type of rocks through which groundwaters flow [5, 7].

Water | Free Full-Text | Radon in Groundwater of the ...

Dissolved helium and radon anomalies are used to quantify groundwater input to Florida Bay waters. The method relies on the fact that groundwater dissolves large quantities of 4 He and 222 Rn isotopes, radioactive decay products of the uranium-chain elements, which accumulate over geological time periods. Seasonal surveys in Florida Bay show average helium concentration anomalies of 13.6% and ...

Helium and radon as tracers of groundwater input into ...

waters. Radon-222 is an emerging tracer for measuring groundwater-surface water interaction which has been underexploited in New Zealand. The aim of this research was to establish the potential of using radon for measuring groundwater and river water interaction in the New Zealand environment.

The use of radon and complementary hydrochemistry tracers ...

The objective of this study was to investigate whether 222Rn in groundwater can be used as a tracer for light non-aqueous phase liquid (LNAPL) quantification at a field site treated by dual-phase LNAPL removal. After the break of a pipeline, 5 ha of soil in the nature reserve Coussouls de Crau in southern France was contaminated by 5100 m3 of crude oil. Part of this oil seeped into the ...

222 Rn as Natural Tracer for LNAPL Recovery in a Crude Oil ...

Radon is typically used in studies of ground water interaction with streams and rivers because a relatively short residence time in a stream or river channel will suffice for loss of most of the radon in a parcel of water. Any significant concentration of radon in a stream or river is a sensitive indicator of local inputs of ground water.

USGS -- Isotope Tracers -- Resources

The RAD-7 Aqua circulates seawater from an intake valve from the sample site into an air-water exchanger by a peristaltic pump, enabling positively charged radium isotopes to be released into a closed-air loop that is attracted to a ground potential semiconductor in the RAD-7 where it is measured.
