A guide to CMOS deep-sky astrophotography Calibration frames (darks, bias and flats) are an integral part of DSO processing. The trade-off from long exposures is the potential for noise and vignetting to affect images, which makes processing challenging. Dark and bias frames reduce noise, while flat frames remove any vignetting.

Stars are bright and the night sky is dark. Therefore the high contrast at the edges of stars creates a certain amount of chromatic aberration, CA. One way to reduce it is to stop down your lens, but the focus also affects the amount (and color) of the CA. The better you focus, the less CA you can see.

In night sky photography, except for star trails, you want to have stars like points of light. But stars move across the horizon at, on average, about 15°/hour because of Earth's rotation. That does not seem much when we stargaze. But consider that a 100mm lens on a full-frame camera gives you a field of view of only about 20° x 15°.

A Beginners Guide to Shooting Night Sky Photography

To put it simply, astrophotography is the art of shooting astronomical or celestial objects. Subjects range from merely using the night sky to make landscape pictures pop to taking super sharp and close up images of distant galaxies. Types of Night Sky Photography You can divide this type of photography into two basic classes.
