Algorithm for Stable Matching Stable Matching Algorithm The Stable Marriage Problem Structure

In mathematics, economics, and computer science, the stable marriage problem (also stable matching problem or SMP) is the problem of finding a stable matching between two equally sized sets of elements given an ordering of preferences for each element. A matching is a bijection from the elements of one set to the elements of the other set. A matching is not stable if:

Stable marriage problem

Buy The Stable Marriage Problem: Structure and Algorithms (Foundations of Computing) by D Gusfield (ISBN: 9780262071185) from Amazon's Book Store. Everyday low

women, where each person has ranked all members of the opposite sex in order of preference, marry the men and women together such that there are no two people of opposite sex who would both rather have each other than their current partners. If there are no such people, all the marriages are “stable” (Source Wiki).

Stable Marriage Problem - GeeksforGeeks

The stable marriage problem is a well-known problem of matching n men to n women to achieve a certain type of “stability;” the $O(n^2)$ time Gale-Shapley [GS] algorithm for finding two particular, but extreme, stable marriages (out of a possibly exponential number of stable marriages) is also well known. In this paper we consider four problems

...

Compared to other books on stable matching, including *Marriages Stables* by Donald Knuth and *The Stable Marriage Problem: Structure and Algorithms* by Dan Gusfield and Robert W. Irving, *Two-Sided Matching* focuses much more on the economic, application-specific, and strategic issues of stable matching, and much less on its algorithmic issues.
