These computers/devices connect to the local area network with a use of wireless network or Ethernet cable. Both office and home settings may have a LAN connection. If computers, tablets, routers, or wireless printers connect via a wireless connection, then they are part of a LAN.

VLAN (virtual local area network) —A network allowing systems on separate physical networks to communicate as if they were connected to the same physical network. Client-Server —A network where powerful, dedicated systems called servers provide resources, files, devices, and even processing power to individual workstations or clients.

Understanding Networks and TCP/IP | What Is a Network ... TCP/IP was originally developed for Unix networks and is the protocol of the Internet and most local-area networks. Ethernet is a low-level protocol that spells out the electrical characteristics of the network hardware used by most local-area networks.

Network Basics: Understanding Protocols - dummies Determine the number of computers you want to connect. The number of computers you're connecting will determine the type of network hardware you'll need. If you are connecting four or less computers, you'll just need a single router, or one switch if you don't need internet.
