Wavelet methods for pointwise regularity and local oscillations of functions. [Stéphane Jaffard; Yves Meyer] -- We investigate several topics related to the local behavior of functions: pointwise Hölder regularity, local scaling invariance and very oscillatory "chirp-like" behaviors.

Hölder regularity is the most widely used notion of pointwise regularity, . We give a review of the definition: Let $\alpha \geq 0$ and $x_0 \in \mathbb{R}^d$ and a locally bounded function $f : \mathbb{R}^d \rightarrow \mathbb{R}$. We say that $f \in C^\alpha(x_0)$ if there exists a constant $C > 0$ and a polynomial P with degree $\deg(P) < \alpha$ such as: $|f(x) - P$

We study different characterizations of the pointwise Hölder spaces $C^s(x_0)$, including rate of approximation by smooth functions and iterated differences. As an application of our results we study the class of functions that are Hölder exponents and prove that the Hölder exponent of a continuous function is the limit inferior of a sequence of continuous functions, thereby improving a ...

The Fourier transform analyses the global regularity of a function. The wavelet transform makes it possible to analyze the pointwise regularity of a function. A signal is regular if it can be locally approximated by a polynomial.

The main goal of our article is to show that this is not the case: the latter Hölder exponents can also be expressed as lower limits of sequences of continuous functions. Our proof mainly relies on a ``wavelet-leader'' reformulation of a nice characterization of pointwise Hölder regularity due to P. Anderson.

Thus, the first problem is to mathematically define a function's regularity at every point.
