cross-polarization level, and smaller size.

## Wideband microstrip-fed printed bow-tie antenna for phased ...

Abstract: A design concept for a compact ultra-wideband printed bowtie antenna is presented in this paper. The antenna is designed for wideband applications over a 500 MHz-2.5 GHz frequency band. The design features a unique Y-shaped bowtie configuration to achieve ultra-wideband performance.

## A compact printed bowtie antenna for ultra-wideband ...

Wide Band Printed Bowtie Antenna Element Development for Post Reception Synthetic Focusing Surface Penetrating Radar.

## Wide Band Printed Bowtie Antenna Element Development for ...

Abstract: A modified printed bow-tie antenna is designed to simultaneously cover the operations in the C and X-bands from 5.5 to 12.5 GHz. The presented antenna has an end fire radiation pattern that makes it suitable for integration in single and dual polarized phased array systems. The antenna exhibits small size and wide bandwidth of 91%.

## Wide-band modified printed bow-tie antenna with single and ...

A simple Bowtie wire antenna (not full), sized, and optimized is visible in figure 5. Its fundamental operating frequency is 433.92 MHz and its parameters are as follows: fundamental frequency: 433.92 MHz; wavelength: 0.69137 meters; total width: 21.278 cm; distance between the two triangles: 16.5 mm; maximum height of the triangles: 10 cm;

## Study and Implementation of Wideband Bow-Tie Antennas

Wideband Antennas If you think about the Half-Wavelength Dipole Antenna, the antenna design is specified by the length - the length should be equal to a half-wavelength at the frequency of interest. Hence, if you want your antenna to radiate at 300 MHz (1 wavelength at 300 MHz = 1 meter), you would make the antenna 0.5 meters long.

## Bow Tie Antennas - Antenna Theory

EXAMPLE of Bowtie Antenna: INPUTS : Operating Frequency = 2400 OUTPUTS: Wavelength = 125 mm, BW = 792 MHz, Width = 46.875 mm, Distance = 2.5825 mm , Height = 31.25 mm .

Formula/Equations used in Bowtie Antenna Calculator. Following formula/equations are used in the Bowtie Antenna Calculator.

## Bowtie Antenna basics | Bowtie Antenna Calculator

Both the bowtie antenna and the AMC surface are fabricated and measured. The measured results demonstrate good and stable performances, including maximum gain of 8.27dBi, and ?at gain response with variation of 0.6dB in the wide impedance matching (S.  $11 < ?10$ dB) band from 3.05GHz to 4.35GHz (35.1%).

## Broadband and Gain Enhanced Bowtie Antenna with AMC Ground

ABSTRACT: A microstrip-fed printed bow-tie antenna is presented in order to achieve wide bandwidth, high gain, and size reduction. A com-parison between the bow-tie and the quasi-Yagi (dipole and director) antennas shows that the bow-tie antenna has a wider bandwidth, higher gain, lower front-to-back ratio, lower cross-

polarization level, and

## WIDEBAND MICROSTRIP-FED PRINTED BOW-TIE ANTENNA FOR PHASED ...

Abstract: A wide-band unidirectional cavity-backed bowtie antenna with stable radiation patterns is proposed in this paper. It is differentially fed by a parallel strip line via a transition from a microstrip line. The corners of the conventional triangular bowtie dipole are rounded to achieve a larger impedance bandwidth.

## Wideband Cavity-Backed Bowtie Antenna With Pattern ...

Printed microstrip antennas are widely used in phased-array applications because they exhibit a very low profile, small size, lightweight, low cost, high efficiency and easy methods of fabrication and installation.

## WIDEBAND MICROSTRIP-FED PRINTED BOW-TIE ANTENNA FOR ...

A modified printed bow-tie antenna is designed to simultaneously cover the operations in the C and X-bands from 5.5 to 12.5 GHz. The presented antenna has an end fire radiation pattern that makes it suitable for integration in single and dual polarized phased array systems. The antenna exhibits small size and wide bandwidth of 91%.

## [PDF] Wide-band modified printed bow-tie antenna with ...

abstract = "A super wideband printed modified bow-tie antenna loaded with rounded-T shaped slots fed through a microstrip balun is proposed for microwave and millimeter-wave band imaging applications. The modified slot-loaded bow-tie pattern increases the electrical length of the bow-tie antenna reducing the lower band to 3.1 GHz.
